Invention Title: VEHICLE BARRIER SYSTEM

The following statement is a full description of this invention, including the best method of performing it known to us:-

VEHICLE BARRIER SYSTEM

This invention relates to a vehicle barrier system and relates particularly, though not exclusively, to a vehicle barrier system to prevent intrusion through a barrier by an
5 unauthorised vehicle.

Threats from car bombs have become prevalent amongst terrorists throughout the world. Terrorists will ram a gate of an embassy or other selected building with a vehicle. Once entry is gained they detonate their bomb as close to the building as possible to maximise
10 the death and injuries caused by their actions. Gates and doors are necessary to gain access to the building or perimeter fence and provide a weak link for such terrorist attacks. Most gates rely on the weight of the gate and its mounting to a foundation to decelerate such vehicles. These gates do not attempt to absorb the shock and the vehicle may still penetrate a significant distance. The resulting damage is usually significant and will
15 require costly and timely replacement.

It is an object of the present invention to provide a vehicle barrier system that will absorb the impact energy from the moving vehicle and reduce the penetration distance when the vehicle has been stopped.

A further object of the invention is to provide a vehicle barrier system that can be readily repaired once vehicle impact has occurred.

In one preferred aspect of the present invention there is provided a vehicle barrier system
25 including a barrier movable between an open position to allow vehicle access therethrough and a closed position which prevents vehicle access therethrough, said barrier being attached to barrier supports at either end of said barrier, said barrier supports being secured to a ground engaging slide plate which will slide after a predetermined force is applied thereto by vehicle impact with said barrier to absorb the impact energy of said vehicle.

30 Preferably said slide plate is sufficiently long to have a part of said vehicle sitting thereon at impact. Preferably said movement of said slide plate is controllable. Preferably said movement is controllable by one or more of a group selected from a ballast attached directly or indirectly to said slide plate, at least one further slide plate attached to said slide

plate, the extension of attachment means attached to said at least one further slide plate and/or said ballast, and the shearing of at least one rivet securing said slide plate to a sliding surface.

- 5 In a practical embodiment a plurality of rivets protrudes through said at least one slot in said slide plate. Preferably a pair of slots are provided and said slide plate rests on a sliding surface formed by a pair of ground engaging beams aligned with respective slots. Preferably a pair of upright beams are secured to the ground in front of respective barrier supports, said upright beams being secured to said pair of ground engaging beams at one
10 end and pivotally and/or slidably linked to said barrier supports at the other end.

In order that the invention may be more readily understood and put into practical effect, reference will now be made to the accompanying drawings, in which:-

- 15 Fig. 1 is a perspective view of a first embodiment of a vehicle barrier system made in accordance with the invention showing the barrier in the closed position;

Fig. 2 is the same view as Fig. 1 in the open position;

Fig. 3 is an underneath view of Fig. 1;

Fig. 4 is a plan view of Fig. 1;

- 20 Fig. 5 is a cross-sectional view along and in the direction of arrows 5-5 shown in Fig. 4;

Fig. 6a is similar view to that of Fig. 5 which includes a part plan view made in accordance with a second embodiment of the invention showing a vehicle moving towards the barrier;

Fig. 6b is a similar view to that of Fig. 6a showing the vehicle impacting the barrier;

- 25 Fig. 6c is a similar view to that of Fig. 6b showing the shearing of the first set of rivets;

Fig. 6d is a similar view to that of Fig. 6c showing the shearing of the second set of rivets;

Fig. 6e is a similar view to that of Fig. 6d showing the shearing of the third set of rivets;

- Fig. 7 is a plan view similar to that of the Fig. 6e of a third embodiment made in
30 accordance with the invention;

Fig. 8 is a similar view to that of Fig. 6e of a fourth embodiment made in accordance with the invention;

Fig. 9a is a similar view to that of Fig. 6a of a fifth embodiment made in accordance with the invention with the barrier closed;

Fig. 9b is a plan view of the vehicle barrier system shown in Fig. 9a with the barrier open;

Fig. 10 is a perspective view of a sixth embodiment made in accordance with the invention; and

5 Fig. 11 is a perspective view of a seventh embodiment made in accordance with the invention.

Throughout this specification the same reference numerals have been used to identify similar integers in the various embodiments to reduce repetition of description. In Figs. 1
10 to 5 there is shown a vehicle barrier system 10 which will protect an opening (not shown) in a perimeter fence or building opening. The vehicle barrier system 10 includes a pair of I-beams 12, 14 mounted parallel with each other. The I-beams 12, 14 are typically secured to the ground by concrete supports 15. I-beams 12, 14 have respective top flanges 16, 18 and lower flanges 20, 22. A pair of hollow beams 24, 26 are welded to respective support
15 plates 28, 30. Apertures 31 in support plates 28, 30 allow support plates 28, 30 to be bolted to concrete supports 15. A cross-beam 32 bridges hollow beams 24, 26. An electric motor 34 is secured to beam 26 and allows barrier 46 to be raised or lowered. Counterweights 36 balance the weight of barrier 46 and are located within hollow beams 24, 26. Pulleys 38 guide a cable 40 on either side of barrier 46 with motor 34 providing
20 movement of cables 40. Barrier guides 42, 44 are secured to the sides of hollow beams 24, 26 and allow sliders 41 coupled to barrier 46 to slide up and down.

A pair of barrier supports 48, 50 are mounted parallel to hollow beams 24, 26. The top of barrier supports 48, 50 are pivotally and slidably linked to beam plates 51 on either side of
25 hollow beams 24, 26. Pins 51c, 51d project through slots 51a, 51b respectively to allow movement of barrier supports 48, 50. At the other end of barrier supports 48, 50 there is attached a slide plate 52. Slide plate 52 rests on the top flanges 16, 18 of I-beams 12, 14. Slots 54, 56 are provided in slide plate 52 and three pairs of rivets 58, 60; 62, 64; 66, 68 are secured to the top flanges 16, 18 of I-beams 12, 14. Attachment beams 70, 72, 74, 76 are
30 welded to the underside of slide plate 52. The attachment beams 70 - 76 have attachment points 78 for attachment thereto of links 79. Links 79 allow pull rods 80, 82 to be connected to ballast 84 by attachment points 86 on ballast 84. Pull rods 80, 82 have a Z-shaped configuration and can be straightened when tensioned. Ballast 84 can be any form of weight, for example, a block of concrete, or a plurality of logs located in a framework as

shown in Figs. 1 to 5. Ballast 84 is located in a trough 88 with the base of the trough 90 being inclined.

5 In the preferred embodiment barrier 46 includes horizontal ram plates 92 which at each end are slidingly located on barrier supports 48, 50 through guide holes 94. A plurality of vertical spacers 96 are welded between respective horizontal ram plates 92 to provide a strong anti-penetration gate. The number and position of vertical spacers 96 can be varied to suit requirements. It is preferred that the spacing between horizontal ram plates 92 is closer at a position where vehicle impact would occur. Vertical slats 98 are welded to
10 horizontal ram plates 92.

In the embodiment shown in Figs. 6a to 6e the ballast 84 has been replaced by a second slide plate 100 which is supported by I-beams 12, 14. The second slide plate 100 is similarly affixed to top flange 18 via rivets 60a, 64a, 66a through slot 56a and
15 corresponding rivets (not shown) and slot (not shown) on I-beam 12. Figs. 6a to 6e provide a sequential illustration of a vehicle 102 attempting to crash through vehicle barrier system 10. The operation of the barrier system 10 is also applicable to the embodiment shown in Figs. 1 to 5.

20 In Fig. 6a, vehicle 102 is moving with a velocity as indicated by arrows 106 and front wheels 104 will roll over second slide plate 100. Barrier 46 will be in the closed position as shown in Fig. 1. Vehicle 102 will continue to move forward and front wheels 104 will roll over slide plate 52 as shown in phantom lines 108 in Fig. 5 to make contact with barrier 46.

25 Fig. 6b shows vehicle 102 having contacted barrier 46 with consequent damage to the vehicle and to vertical slats 98. The slats 98 will crumple and absorb an amount of impact force. The horizontal ram plates 92 and vertical spacers 96 will also assist in reducing the velocity of vehicle 102. Slide plate 52 will be held fast at this time by rivets 58-68, which
30 will be assisted by the weight of vehicle 102 upon slide plate 52 to increase the frictional forces needed to move slide plate 102.

Fig. 6c shows that rivets 66, 68 have been sheared at a predetermined force applied thereto. The force is applied to slide plate 52 through the impact load applied to barrier supports 48,

50 passed from horizontal ram plates 92. Slide plate 52 will thus move to the left as indicated by the increasing width of gap 110 between slide plate 102, the straightening of pull rods 80, 82 and the bowing of barrier supports 48, 50 as shown by phantom lines 112 in Fig. 5. Slide plate 52 will slide along I-beams 12, 14 to move barrier supports 48, 50 with it and pivot and move about pins 51c, 51d. However, hollow beams 24, 26 will not move as they are fastened to I-beams 24, 26. The second slide plate 100 will provide resistance to assist in the straightening of pull rods 80, 82.

Further dissipation of the vehicle impact will occur when rivets 62, 64 are sheared at a further predetermined force applied thereto as shown in Fig. 6d. Gap 110 will widen further and pull rods 80, 82 will be further straightened. Fig. 6e shows rivets 58, 60 being sheared to further increase the width of gap 110. Pull rods 80, 82 have been fully straightened. The weight and speed of vehicle 102 will determine whether all rivets 58-68 will be sheared or whether the impact force is dissipated prior to that occurrence. If vehicle 102 is still not stationary, then the same sequence of shearing of rivets 60a, 64a, 68a, etc will occur for second slide plate 100. This sequence will not be described, as it will be obvious to the man skilled in the art based on the previous operational discussion.

In the embodiment shown in Figs. 1 to 5 the second slide plate 100 is replaced by ballast 84. The operational sequences will very similar with the resistance of the ballast 84 engaging when rivets 66, 68 are sheared. In tests the vehicle barrier system 10 has been effective to prevent a 4000-kg load from entering barrier 46 at 30 km/h. The damaged barrier 46 can be readily replaced as hollow beams 24, 26 are not damaged and the barrier lifting mechanism is on the hollow beams 24, 26. It is a relatively simple procedure to replace barrier 46 as barrier supports 48, 50 can be re-used. The downtime for an attempted intrusion is substantially reduced without compromising safety.

Fig. 7 shows a very similar embodiment to that shown in Figs. 6a to 6e with the addition of a third slide plate 114. Again third slide plate 114 is coupled to second slide plate 100 by pull rods 80a and is fastened to I-beams 12, 14 by rivets 60b, 64b, 68b.

Fig. 8 shows a very similar embodiment to that shown in Fig. 7e with the addition of ballast 84 from the embodiment of Figs. 1 to 5. Ballast 84 is coupled to third slide plate by pull rods 80b.

Figs. 9a and 9b illustrate a further embodiment where barrier 46 is replaced by a pivotal ramp 116 which is attached to slide plate 52 through pivot plates 118. Ramp 116 can pivot between a closed or vertical position as shown in Fig. 9a and a horizontal or open position as shown by phantom lines 120. The ramp 116 is held in either position by a latching mechanism(s) (not shown) and is biased towards the closed position by springs 122. There are slide plates 52, 100, which are constructed and operate in a similar way to those shown in Figs. 6a to 6e. Vehicle 102 can drive over ramp 116 when in the open position as indicated in Fig. 9a but cannot pass when ramp 116 is raised. Ramp 116 can be of any suitable construction to withstand the initial impact by vehicle 102. This embodiment does not have the hollow beams 24, 26. The impact force will be applied to slide plate 52 through the impact load applied to pivot plates 118 rather than barrier supports 48, 50 passed from ramp 116. The movement of slide plates 52, 100 will be the same as that described in Figs. 6a to 6e.

The embodiment shown in Fig. 10 shows barrier 46 being replaced by a pair of swinging gates 124, 126. Slide plate 52 will again operate in a similar manner to that previously described in relation to Figs. 9a and 9b.

The embodiment shown in Fig. 11 is similar to the embodiment shown in Fig. 10 with swinging gates 124, 126 replaced by a sliding gate 128. Slide plate 52 will again operate in a similar manner to that previously described in relation to Figs. 9a and 9b.

From the above description of the various embodiments it is evident to the man skilled in the art may make changes to the construction of the vehicle barrier system 10. Depending on construction constraints slide plate 52 need not be coupled to a further slide plate or ballast. The construction of barrier 46 can be of any suitable type that can withstand a heavy impact. The number and types of slide plates can vary. Similarly, the numbers of rivets can be varied from 1 to any number deemed applicable. The preferred embodiments have been described with reference to their use as a gate but the construction is also applicable to doors of buildings.

The invention will be understood to embrace many further modifications as will be readily apparent to persons skilled in the art and which will be deemed to reside within the broad

scope and ambit of the invention, there having been set forth herein only the broad nature of the invention and certain specific embodiments by way of example.
